

# A Case for Multilevel Modeling

## Designing Models and Systems to Support IT Management

  - General Challenges
  - IT Management: Particular Problems
- Outline of a Solution
  - Multilevel DSML for IT Management
  - Multilevel Management and Monitoring System
- Conclusions

# The Need for IT Management

20

- ever increasing penetration of information systems into organizations
  - pivotal relevance for performing business processes
  - ... for enabling future business models
  - ... for staying competitive
  
- increasing complexity of
  - IT infrastructures
  - IT products
  
- demand for flexibility
  - adaptation of products and services
  - ... requires adaptation of IT

- in the old days: focus on IT administration
- today extended responsibilities
  - accounting for future business needs in time
  - communication with various stakeholders about potential and limitations of IT
- growing pressure on IT management
  - total cost of IT perceived as too high by many executives
  - often, no differentiated knowledge about cost & business value of IT
- still insufficient alignment of business & IT
- cultural chasm between IT professionals and business executives not yet overcome

# Core Responsibilities

20

## ■ managing the IT infrastructure

How many printers do we have per employee?

point of view

How could the support of business processes be improved?

- from a business perspective evaluation of

## ■ decision making

- assessment and planning of IT infrastructure

- aligning IT with business

What was the average availability of our ERP system in 2013?

artefact

What is the level of data integration?

guidelines

- organisation of IT department

How could IT make our business more competitive?

- processes for IT (service) management

- objectives & measures

Complexity demands for models and tools.

# Approaches to Support IT Management

20

- Distributed Management Task Force (DMTF): Common Information Model (CIM)
- Control Objectives for Information and related Technology (COBIT)
- IT Infrastructure Library (ITIL)
- Enterprise Architecture Management

- various database schemata for managing IT resources
  - Applications
  - Networks
  - Databases
  - Metrics
  - ....
  
- no DSMLs (UML like language)
  
- models only as supplement to illustrate relational schemata

- aimed at promoting professional IT management through concepts and guidelines
- emphasis on support of business functions
- for this purpose: emphasis on services & documentation
  - reduction of complexity through abstraction from realisation; separation of concerns and contracts – „service level agreements“ (SLA)
  - no precise notion of service: product, process, provision of IT resource ...
  - templates for defining SLA
- definition of reference services
  - „service support“
  - „service delivery“

- contribution to professional IT management
- wide support by industry
- however: lack of elaborate concepts
  - to describe IT artefacts
  - to evaluate IT artefacts from a technological perspective
  - to analysis for IT business alignment
- only superficial description of processes required to produce services
- ...

no explicit modeling language, no elaborate models

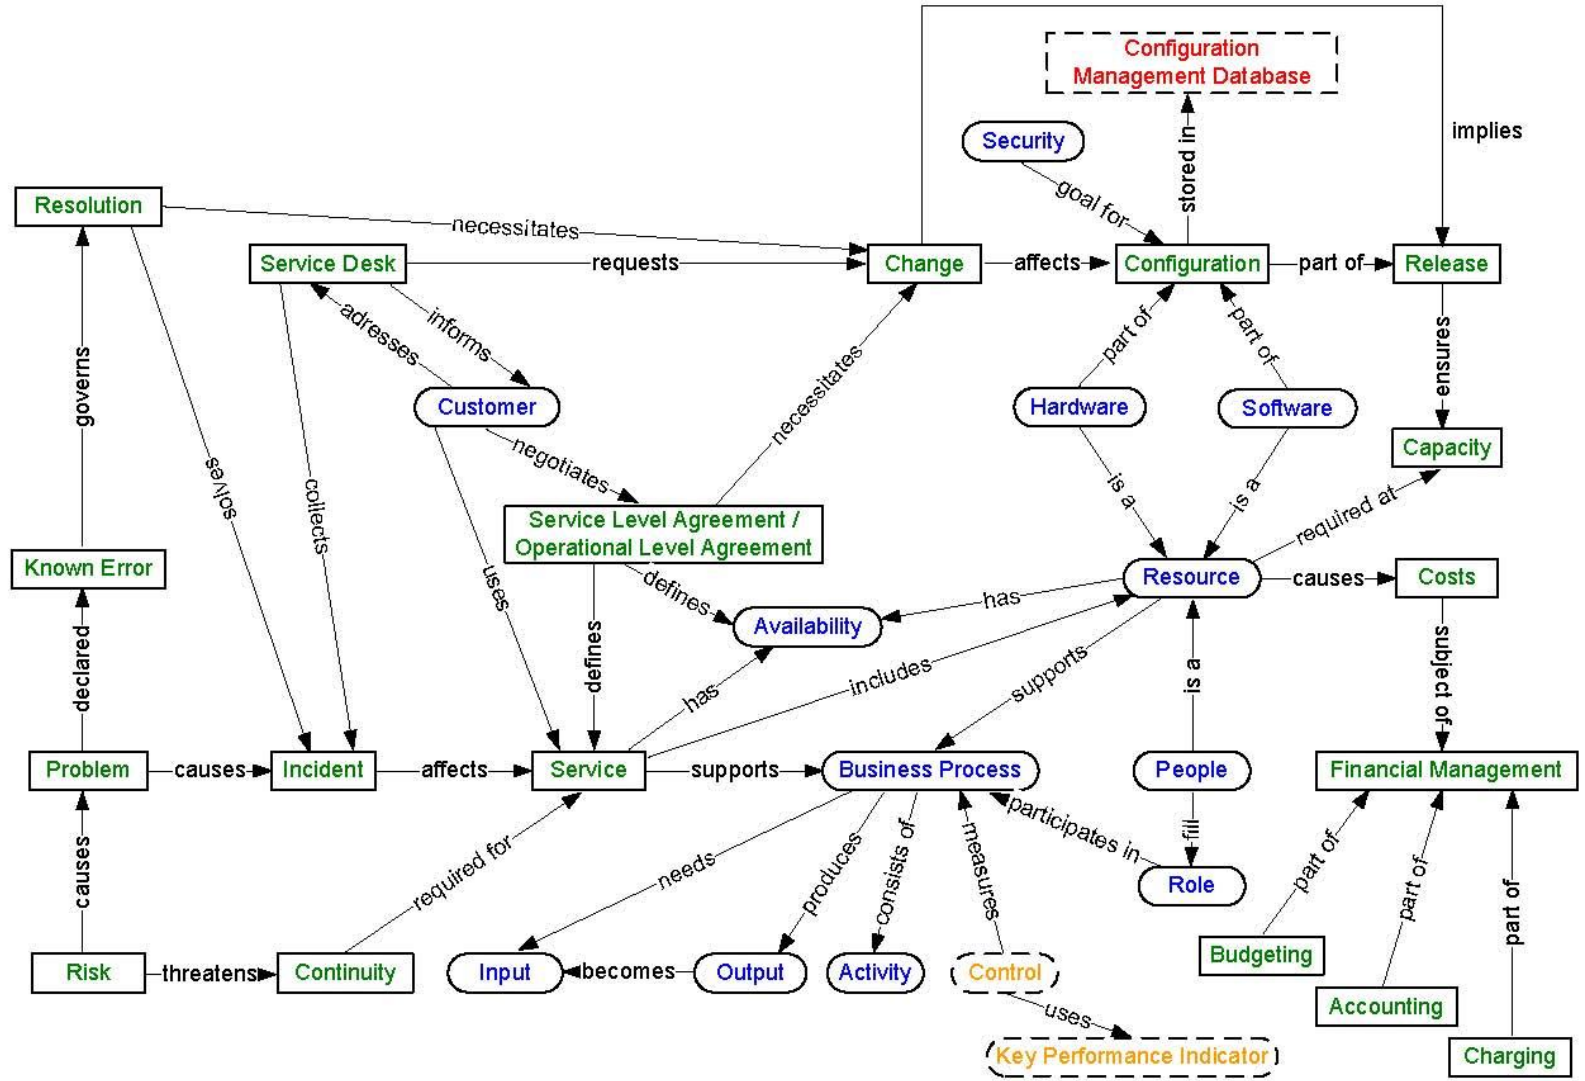

- emphasis on management & control of IT processes that are aligned to business objectives
- for this purpose: definition of core concepts
- definition of core IT processes with emphasis on control objectives, measures and KPIs
- aimed at increasing transparency of IT processes for management and at contributing to evaluating/measuring them
- high level objectives
  - alignment of IT and business (goals)
  - maximizing business benefit from IT
  - adequate management of IT risks

- supplements IT service management with control/accounting aspects
- provides numerous KPIs
- concepts remain on a superficial level
- process descriptions on a high level of abstraction only
- lack of integration with ITIL
  - potential for mutual supplementation
  - however, concepts partially overlapping; different semantics

no explicit modeling language, no elaborate models

# ITIL: Reconstruction of Core Concepts

Concept not available in CobIT     
 Concept corresponding in CobIT     
 [Kirc08], p. 135

Concept more elaborate than in CobIT     
 Concept rich for all ITIL and Multilevel Modeling

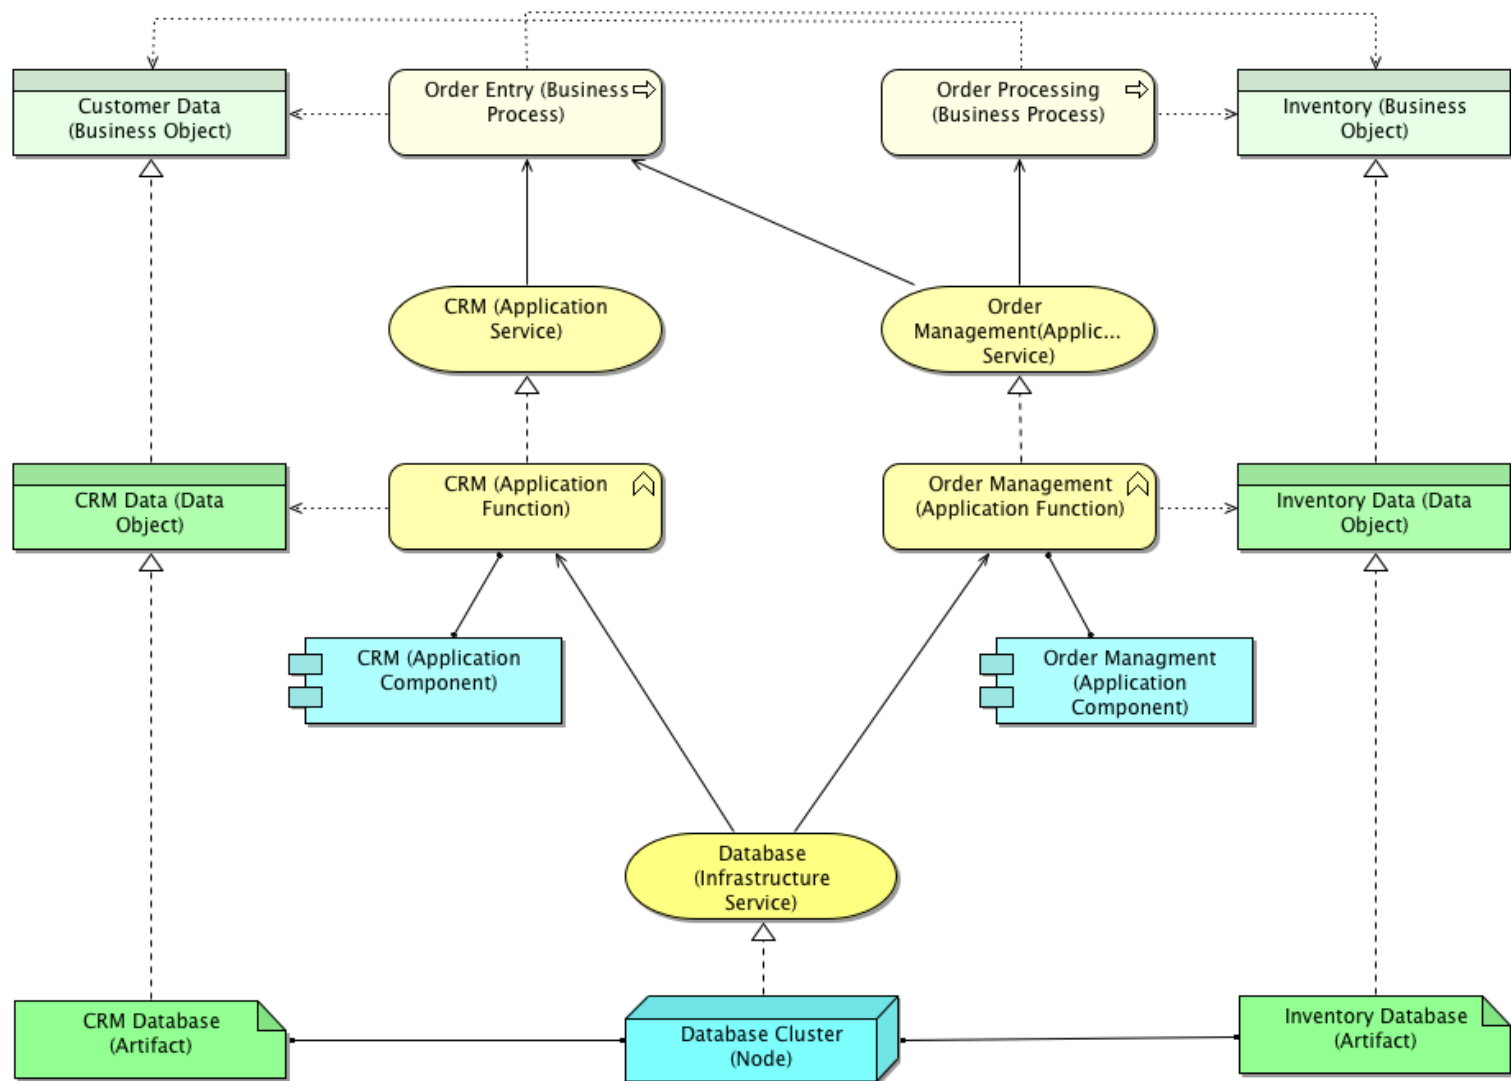

“EAM is a management practice that establishes, maintains and uses a coherent set of guidelines, architecture principles and governance regimes that provide direction for and practical help with the design and the development of an enterprise’s architecture in order to achieve its vision and strategy.”—Ahlemann et al. (2012, p. 20)

- “Enterprise Architecture” as integrated high-level representation of IT infrastructure and business
- often graphical representation without modeling language
- **Archimate**: language for modeling enterprise architectures

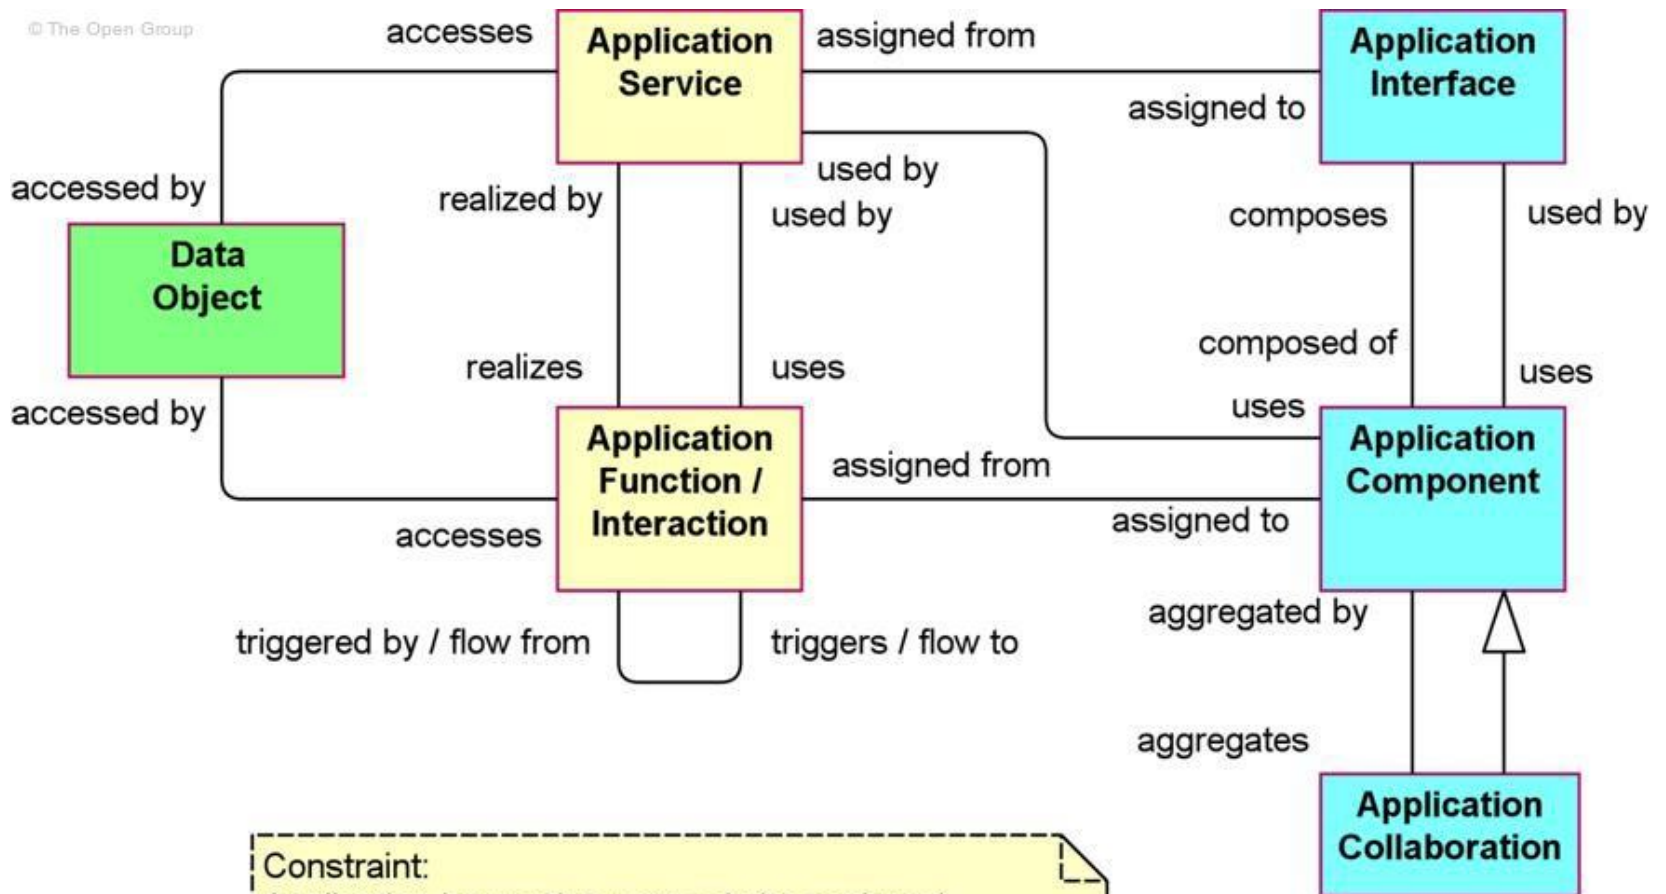

# Archimate: Model of Enterprise Architecture

20

<https://archimatemusings.files.wordpress.com/2013/11/archi-colour-example.png>

# Archimate: „Application Layer Metamodel“

Constraint:  
Application Interaction may only be assigned by an Application Collaboration, not by an Application Component.

- pragmatic approach
- no elaborate DSMLs
- rather generic concepts which can be refined by users
  - allows for various extensions
  - however, no integrity constraints

# IT Management Dashboard

20

- aimed at decision support and awareness
- should provide data relevant for managing IT infrastructures
- focus on aggregate data (KPI), such as
  - availability of resource in time period
  - number of attack attempts
  - number of successful attacks
  - cost per incident
  - IT energy consumption
  - ....
- clearly arranged presentation

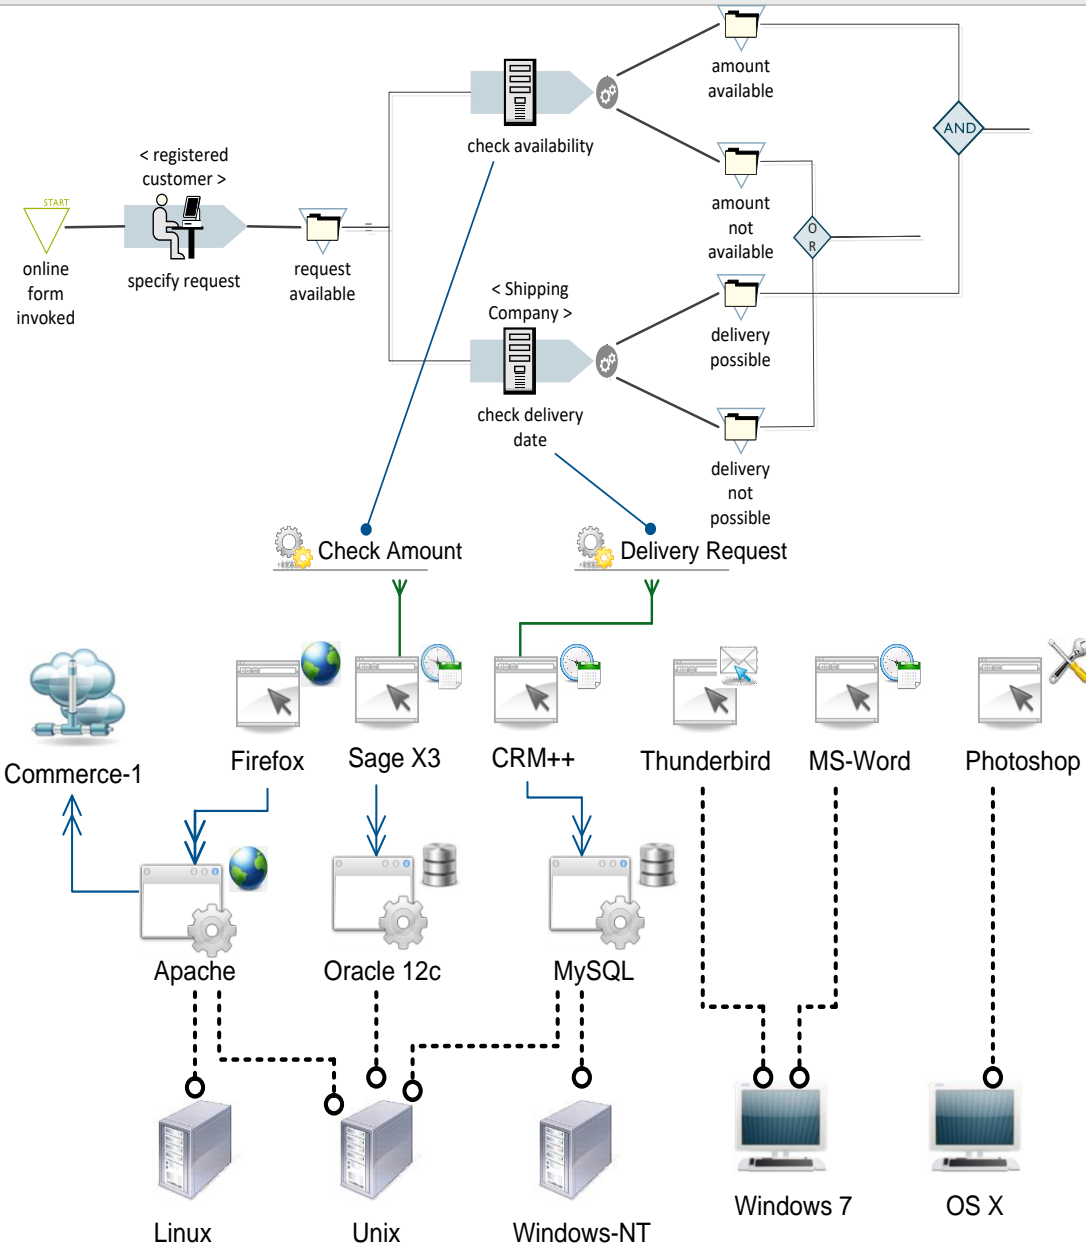

usually proprietary solutions

# Vision (1): Integration with Enterprise Modeling

20

- DSML
  - support for creating elaborate models of the IT infrastructure
  - support for analysis – both from technological and economic perspective
  
- Integration with DSMLs for Enterprise Modeling
  - enables to model and analyse the effect of IT on the business
  - fosters cross-disciplinary communication and collaboration
  - promotes conjoint analysis of IT and business

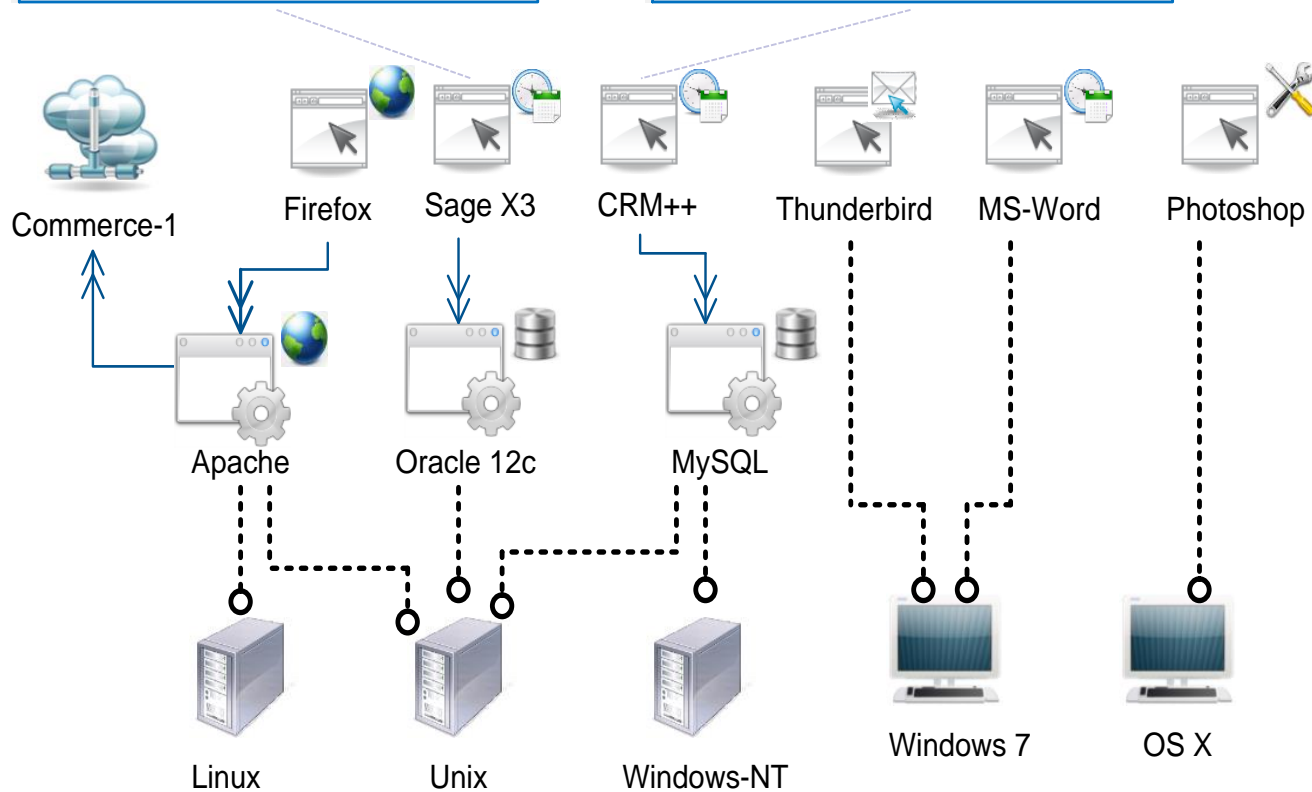

# Illustration (1): Navigation – IT and Business

mission critical:	yes
supportedProcessTypes:	44
lifeCycle:	#late

Language:	C#
source-Code:	no
data Model:	yes
mission critical:	yes
supportedProcessTypes:	2
lifeCycle:	#early

## Vision (2): Integration with Monitoring Tool

20

- account for both, conceptual models and corresponding instances
- integration of modeling environment and monitoring tool
- allows for navigating various interdependent models (IT, business)
- enable advanced users to customize decision support
  - by using DSMLs for adapting models
  - and even allow for modifying DSML

source-Code:	no
data Model:	yes
mission critical:	yes
supportedProcessTypes:	2
lifeCycle:	#early
substitutability:	#high

- DSML: general design problems
  - distinction between language and language application
  - conflict between range of reuse and productivity
- synchronization of (meta-) models and code
- (meta) modeling languages: lack of expressiveness

# Language vs. Language Application

160

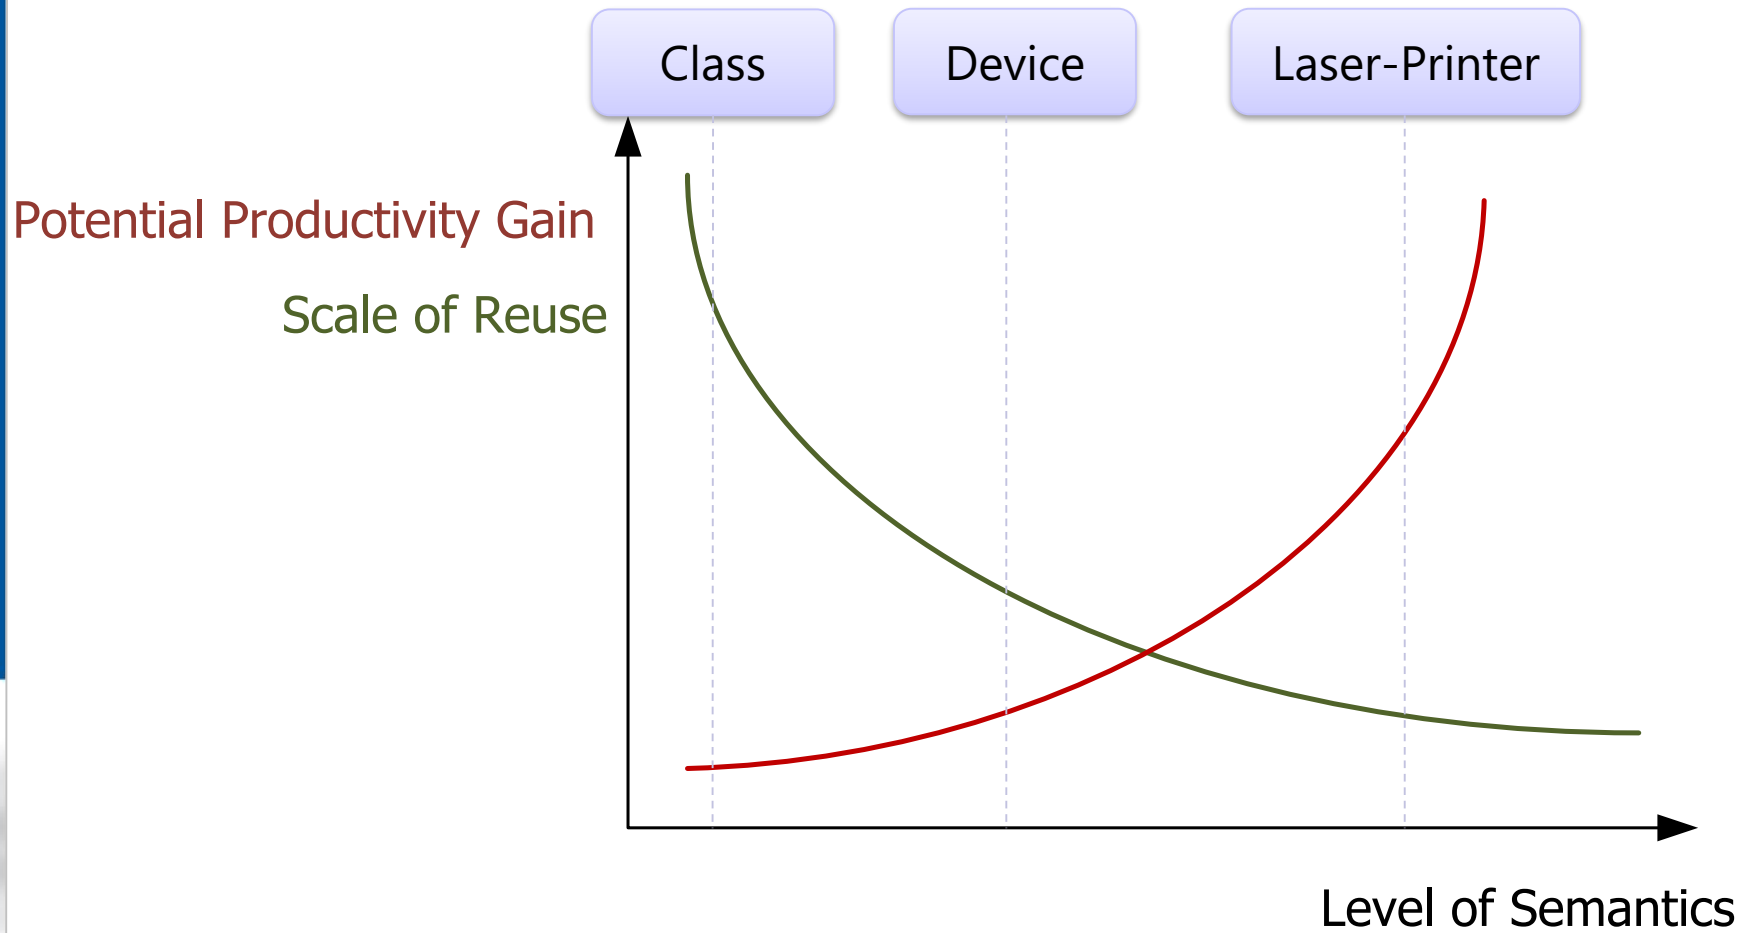

Language concept or language application?

Paradigm requires distinction, but how?

# Essential Design Conflict

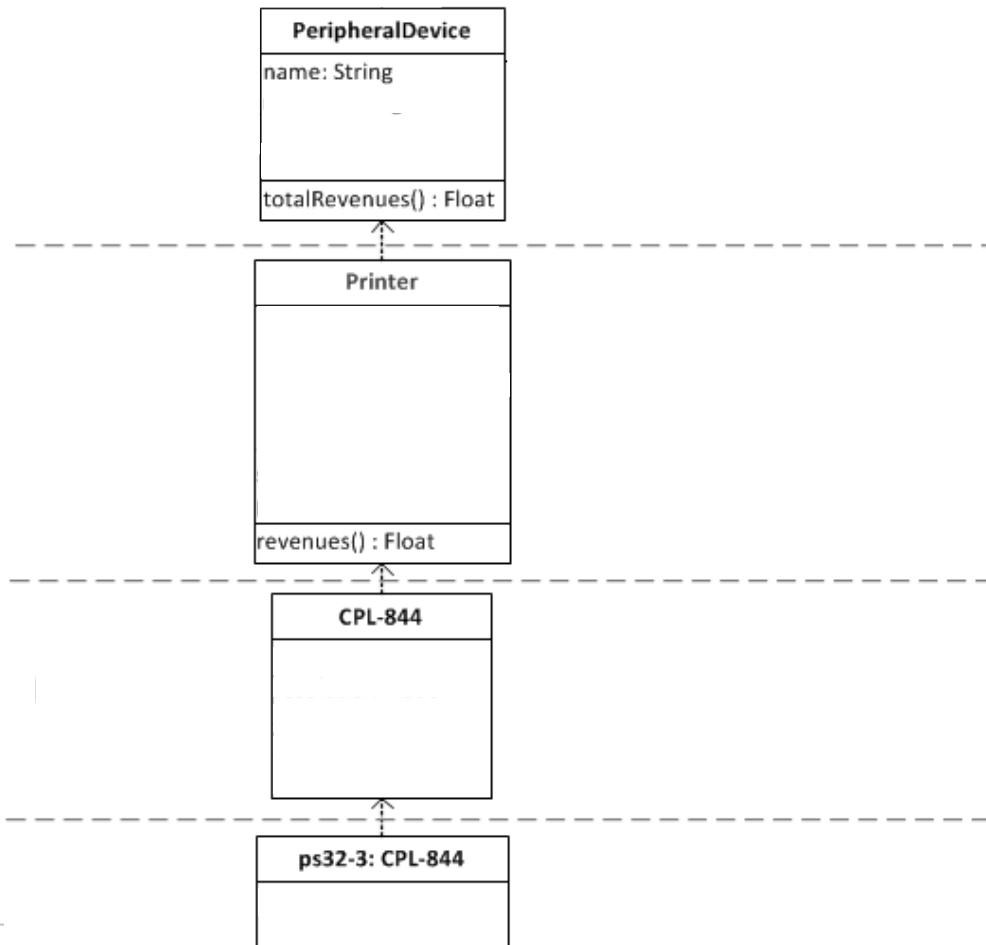

160

# Lack of Expressiveness

Instantiation and specialisation are mutually exclusive.

There is a clear distinction between model and modelling language.

Sometime no clear distinction between instantiation or specialisation – both make sense.

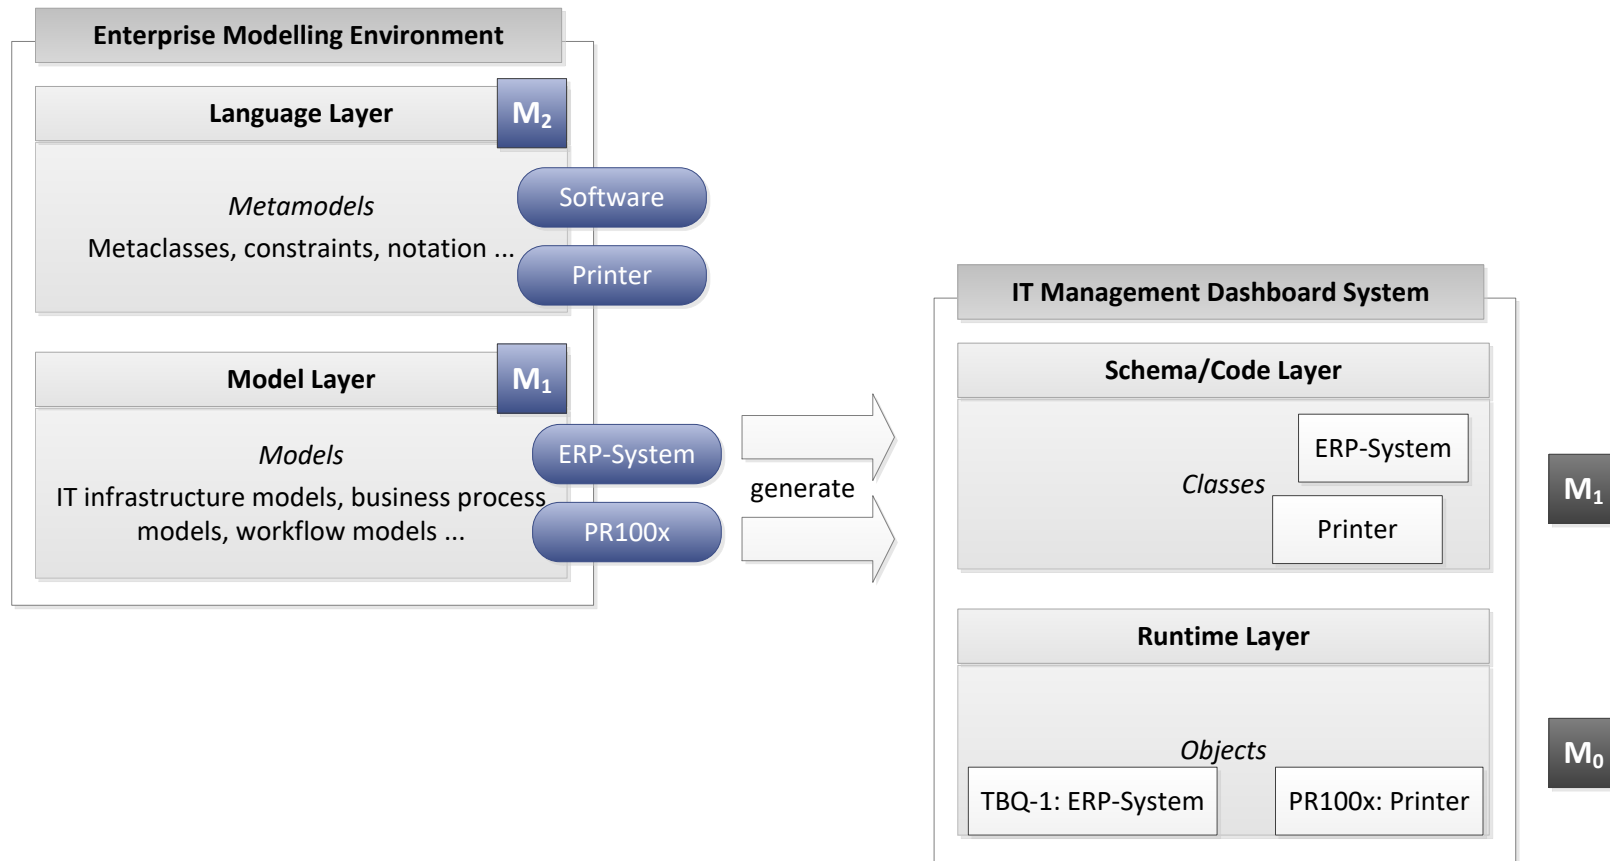

Instantiation sometimes deferred to lower levels.

(Meta) classes may have relevant state.

(Meta) classes may have features that need to be derived or calculated.

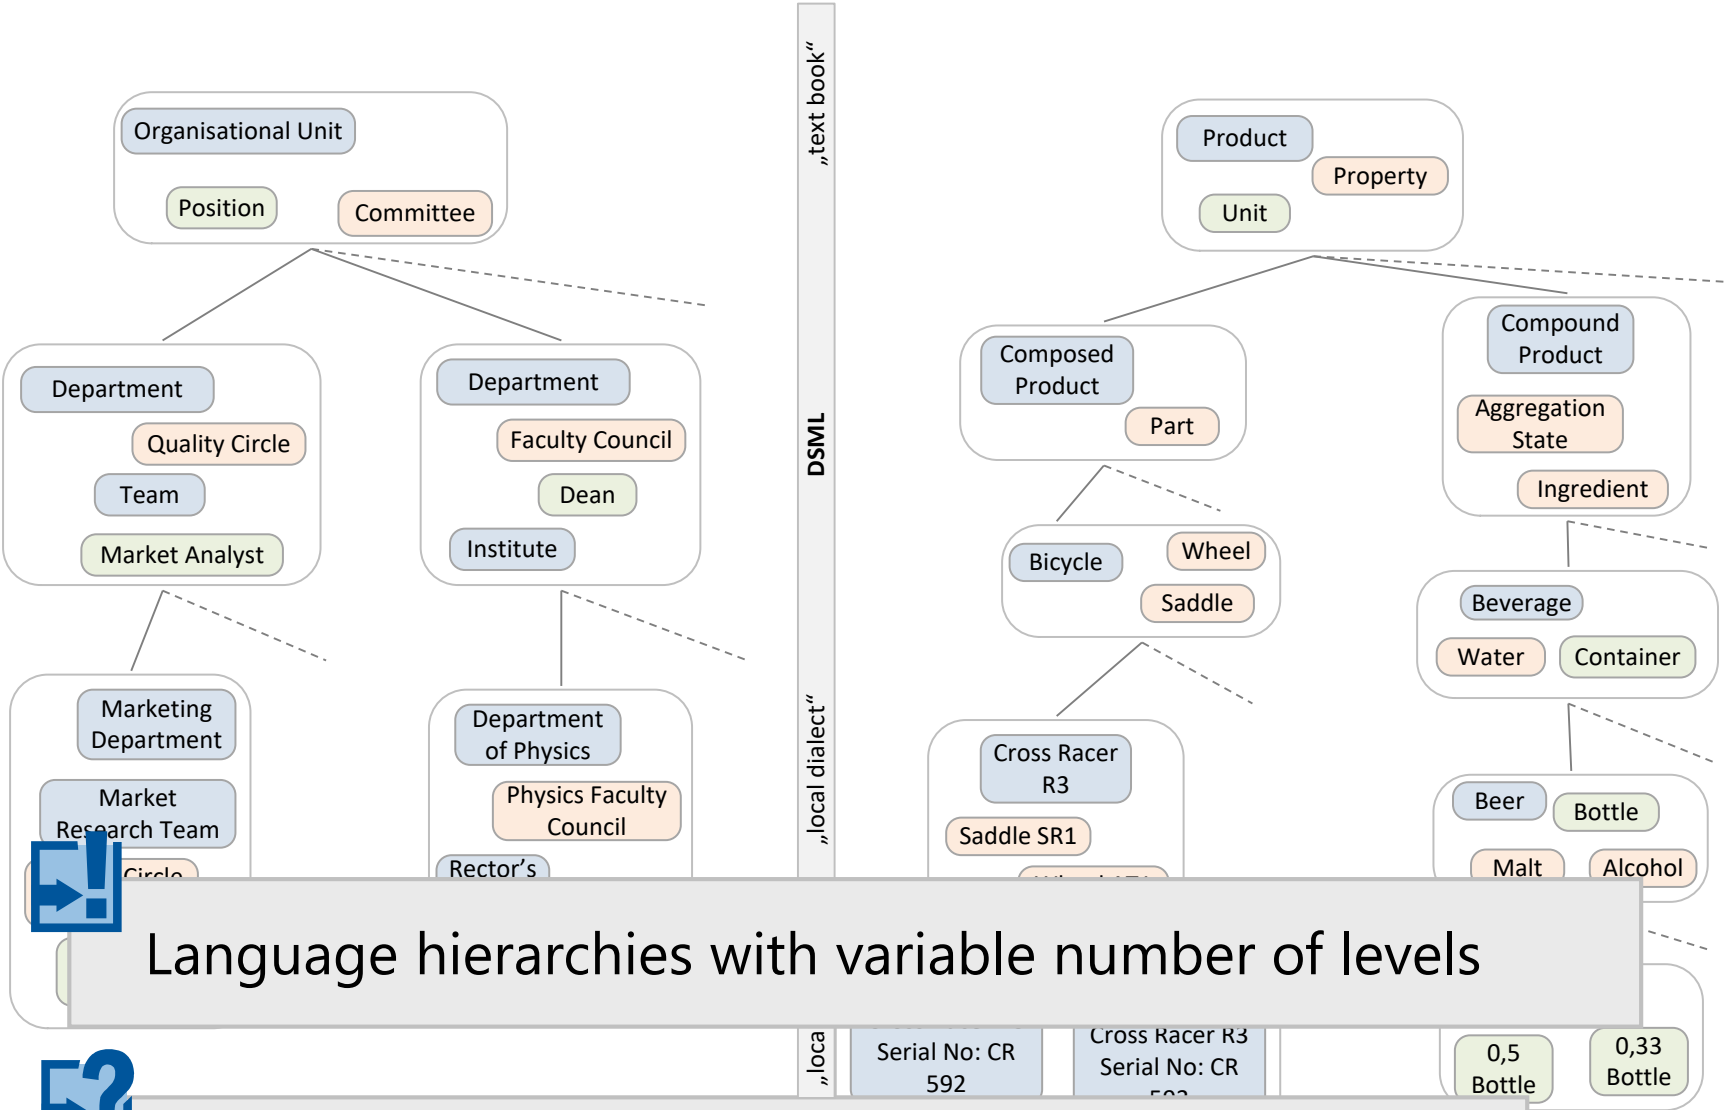

(Meta) classes should be conceptualized as objects.

# Separate Representation of Models and Code

Widely prevents interactive use of models during run time.

# Inspiration: Actual Use of Technical Languages

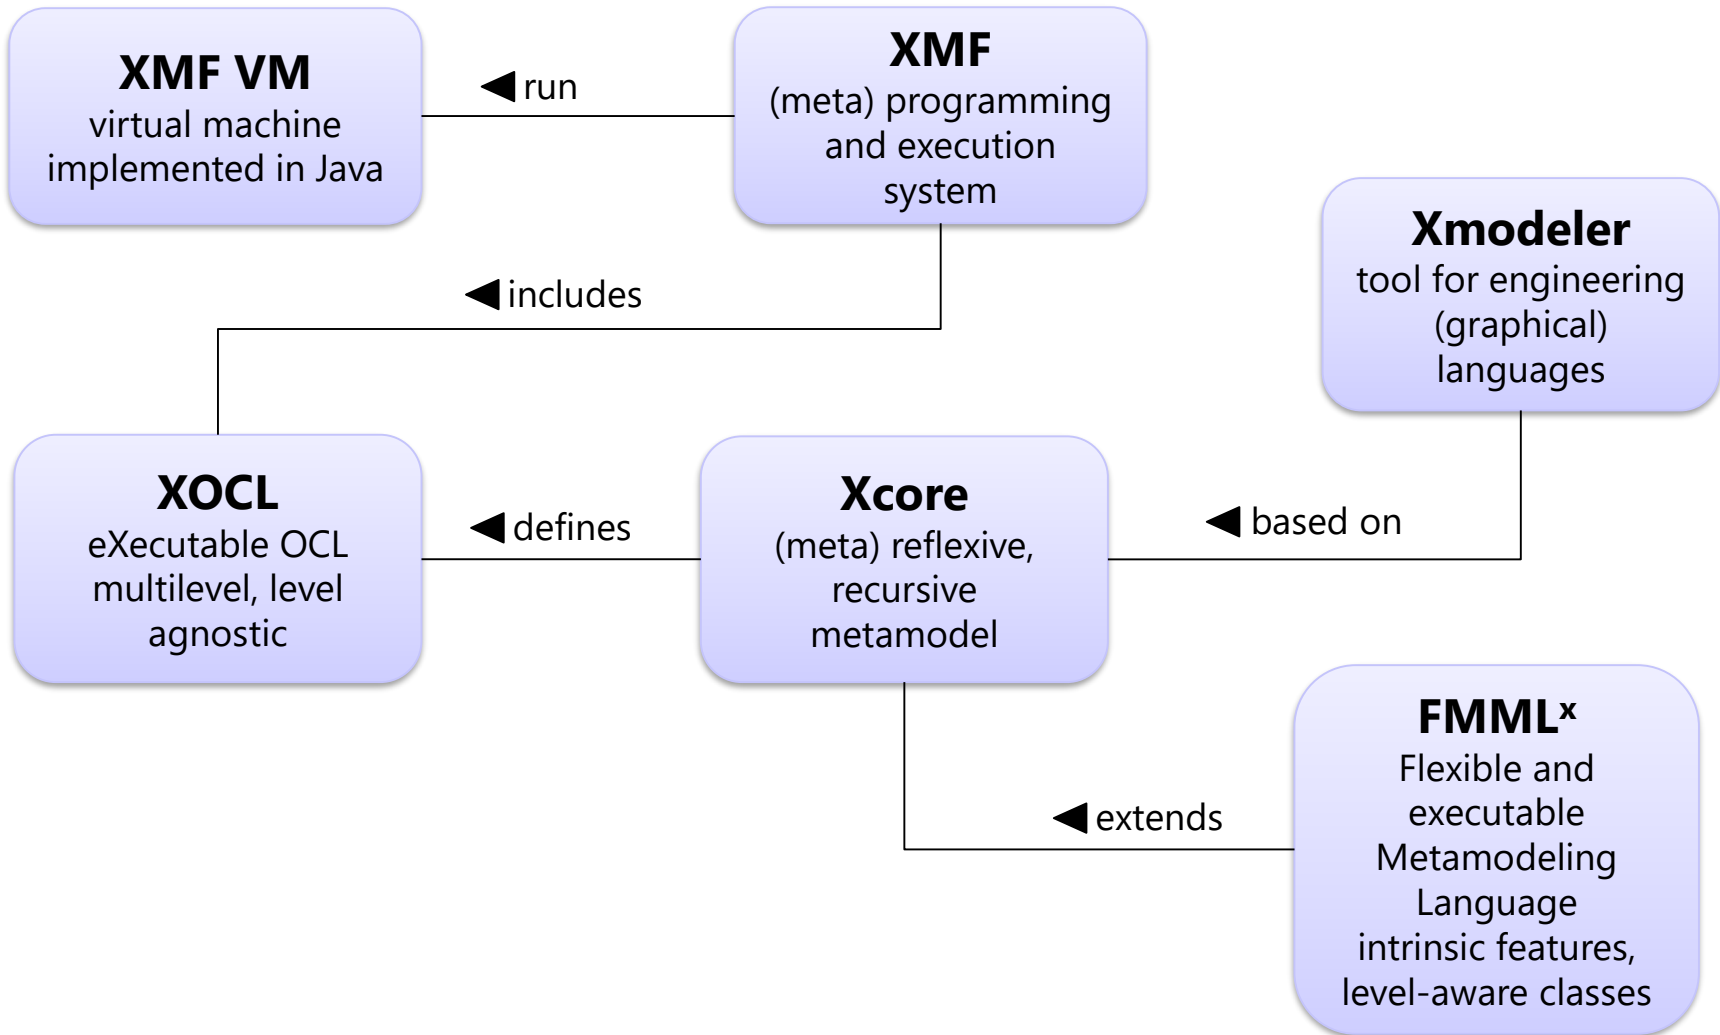

Language hierarchies with variable number of levels

How to represent in modelling tool?

# Outline of a Solution

160

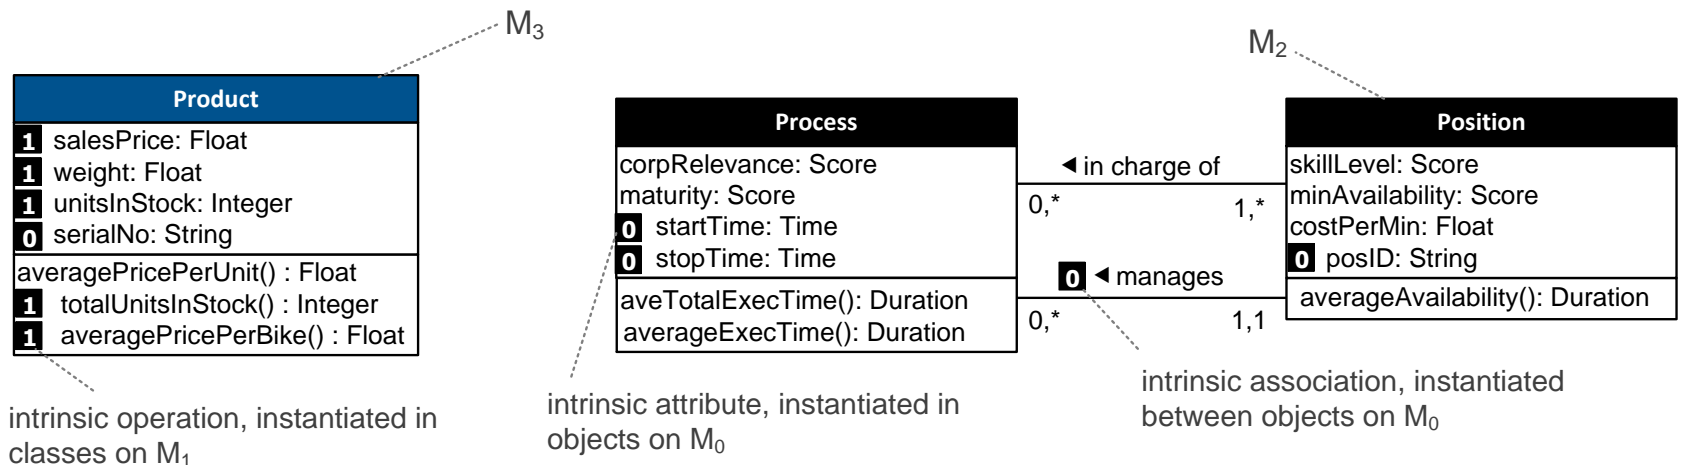

# FMML<sup>x</sup>: Meta-Language for Multilevel Modeling

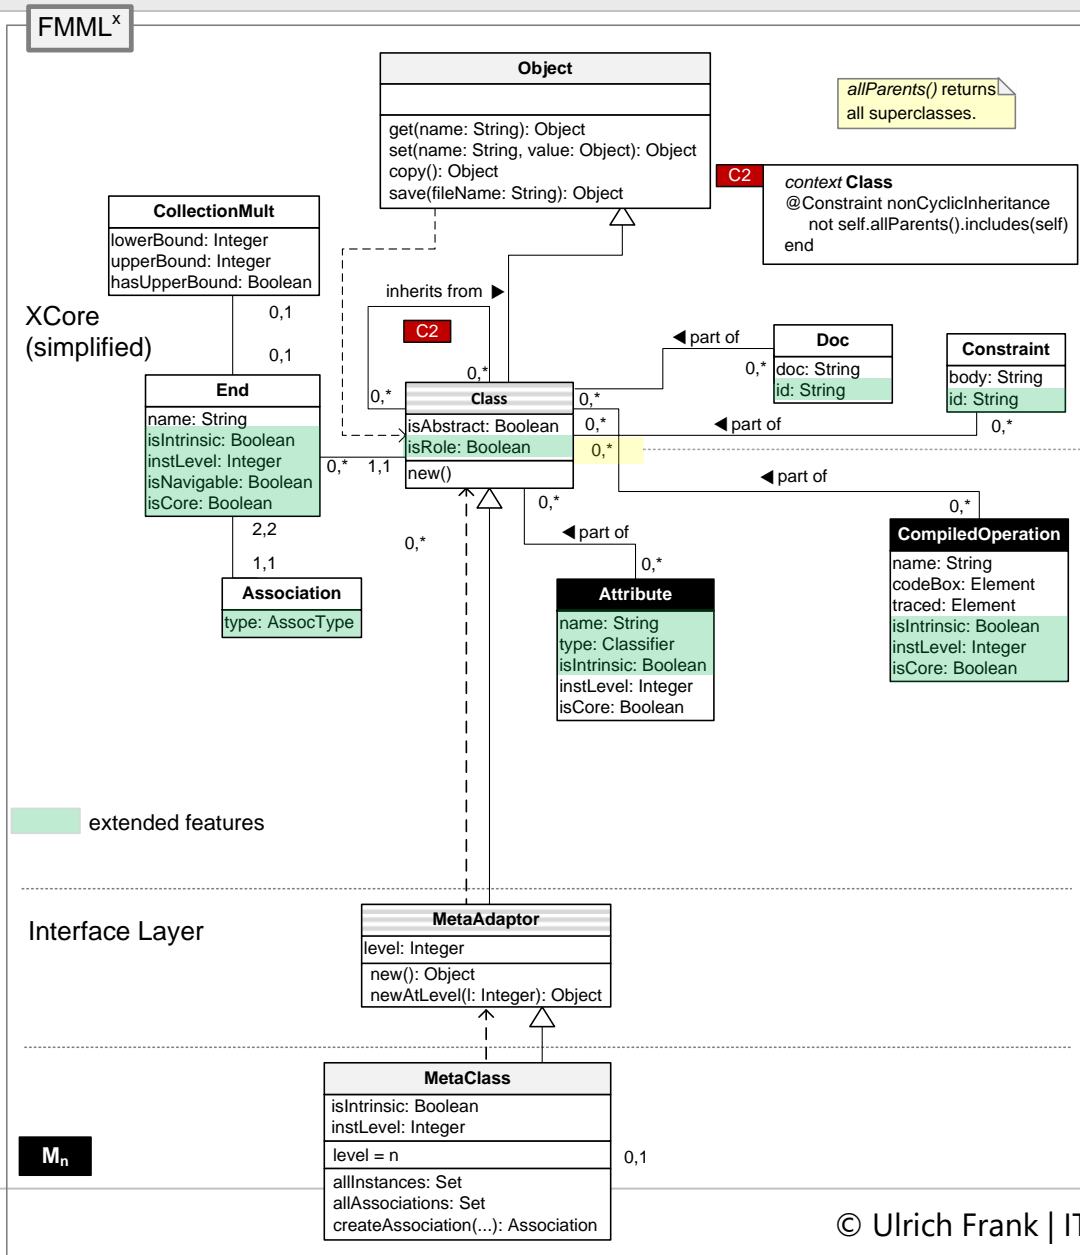

370

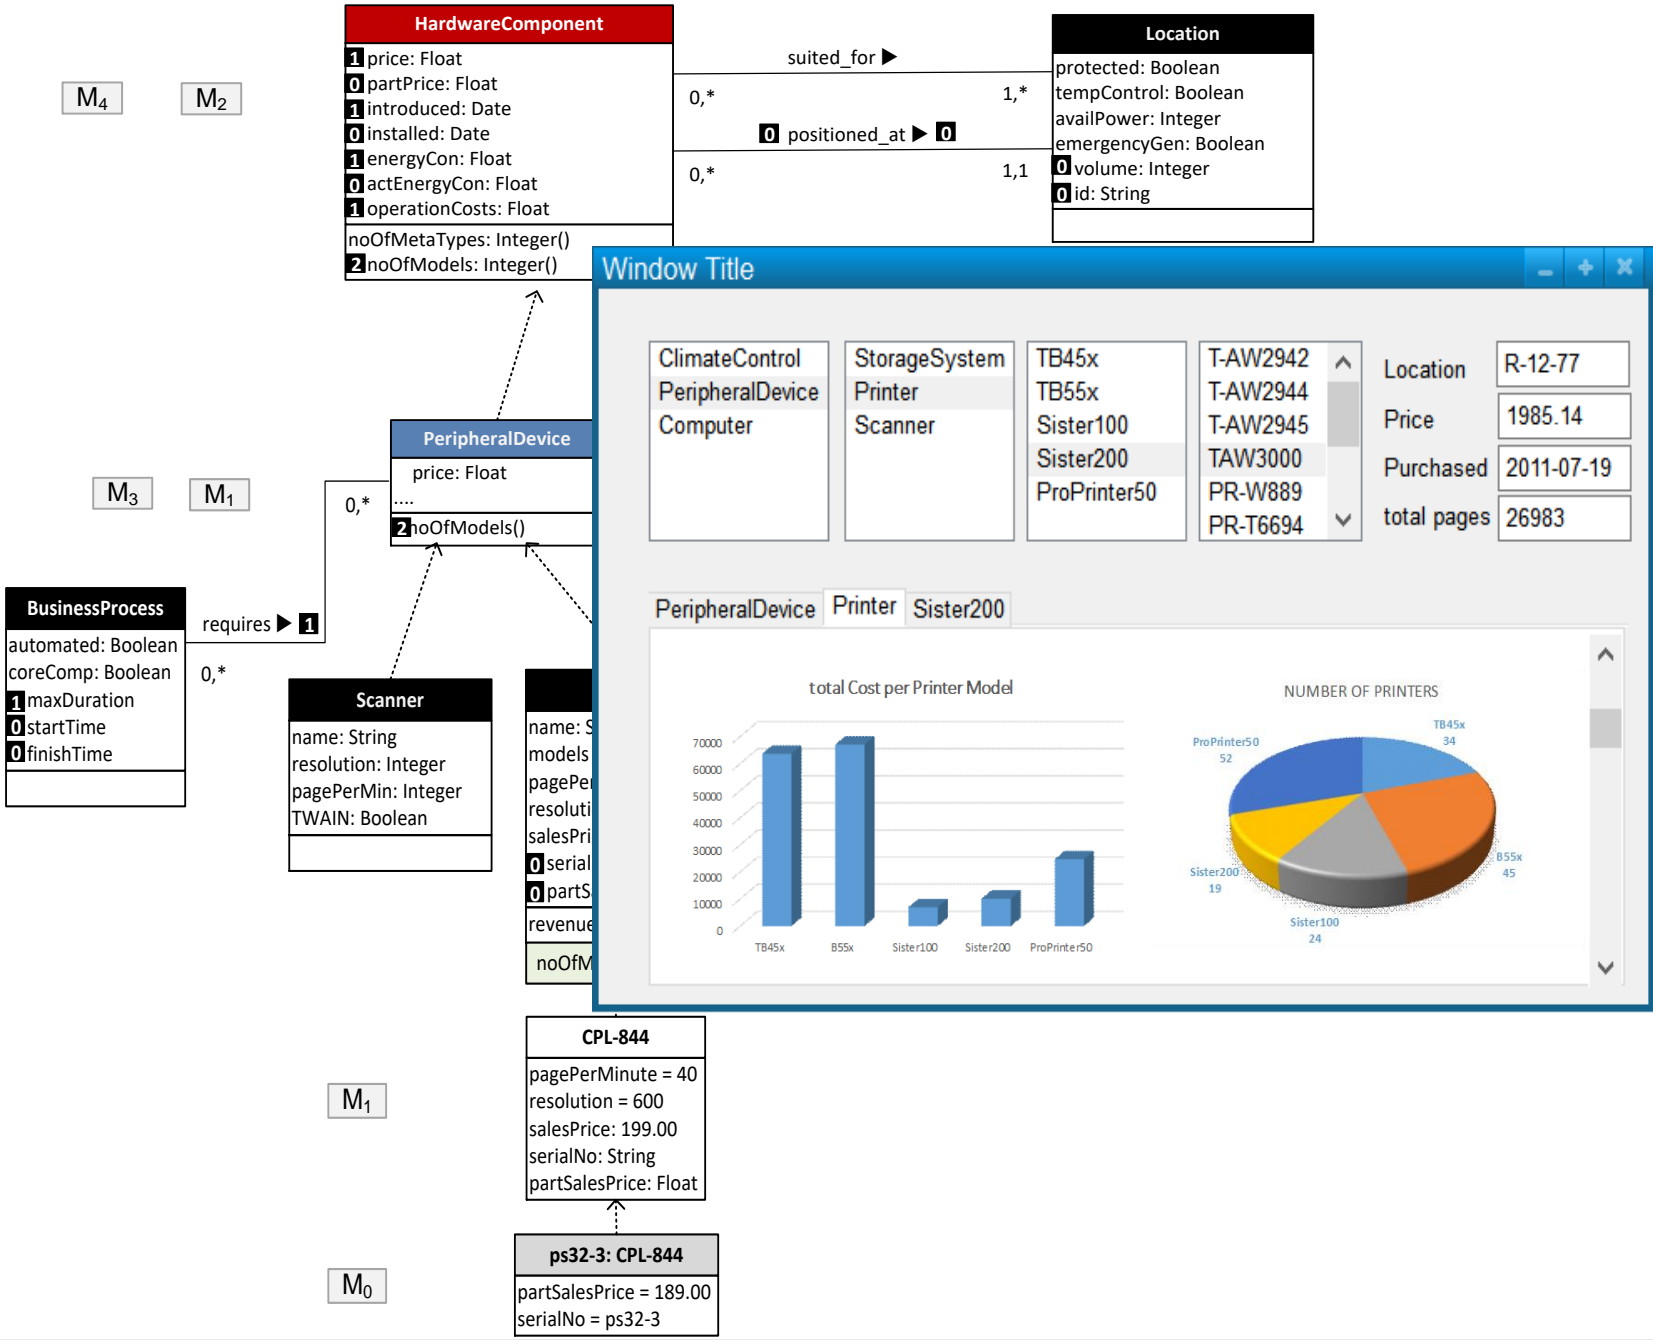

- defined with XMF, extends Xcore
- executable, common representation of models and code
- enables explicit classification levels
- adds intrinsic features
- combines modeling with language engineering

# FMML<sup>x</sup> Metamodel

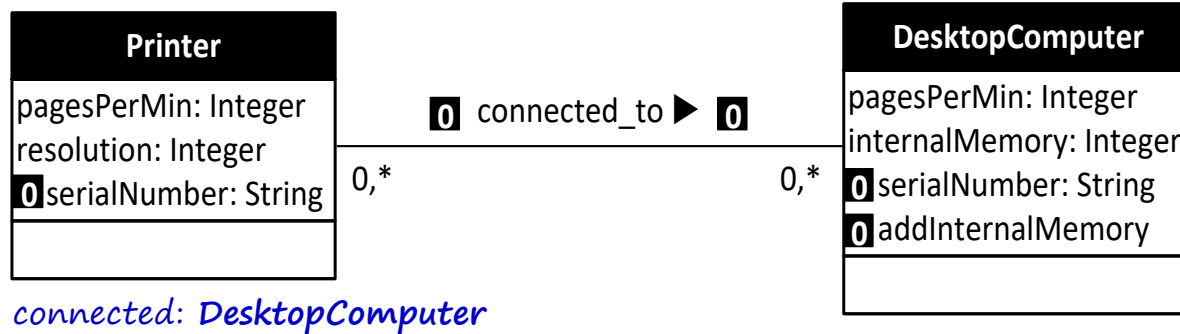

390

# Discussion

400

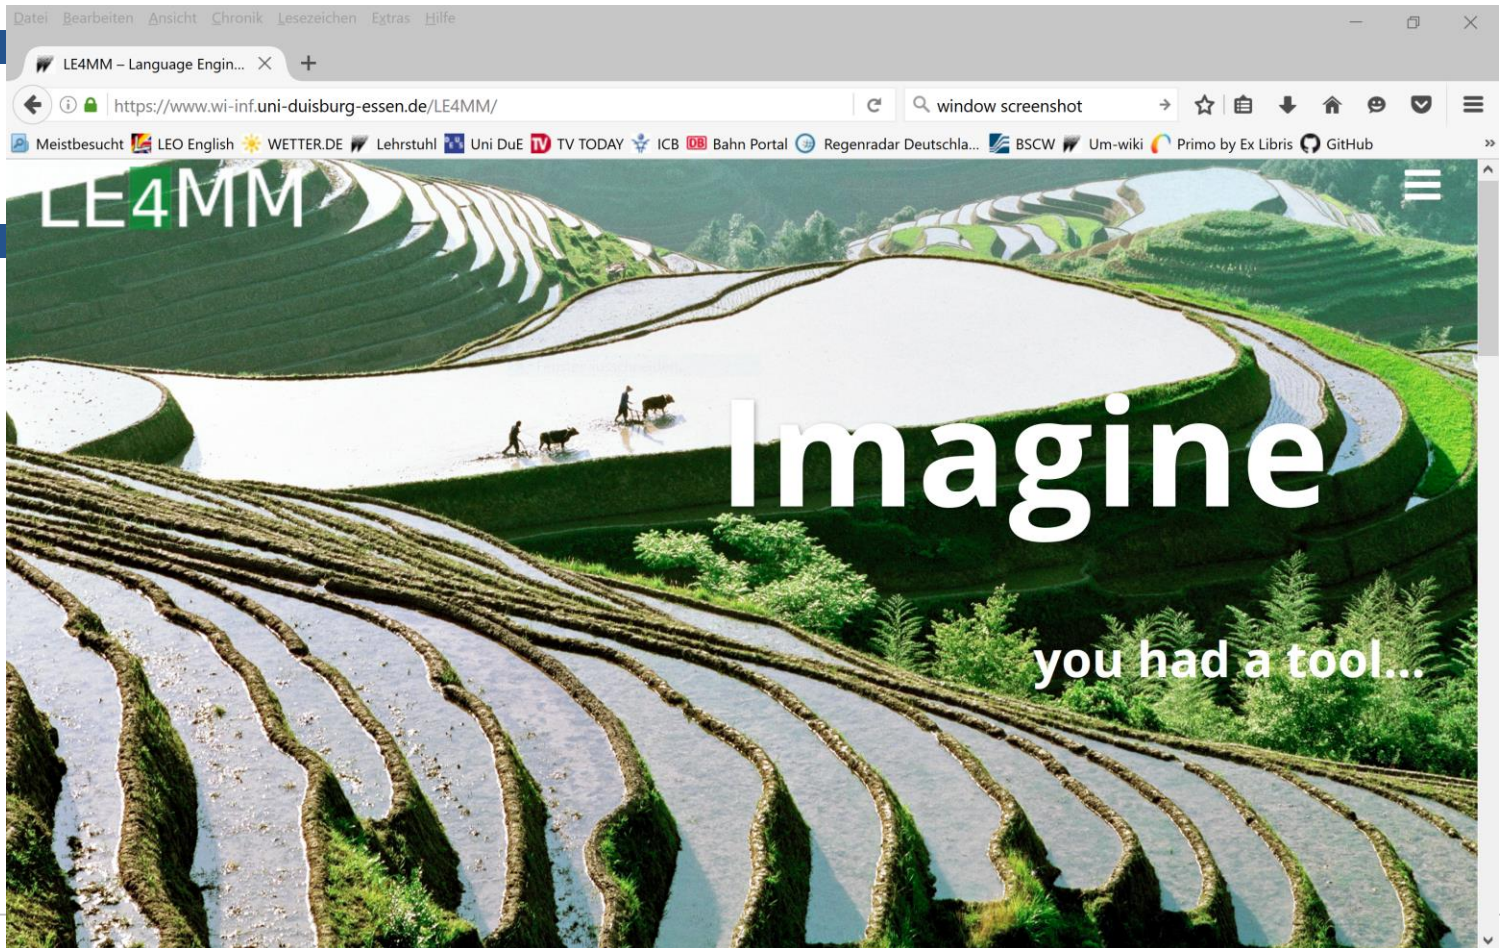

- multilevel DSMLs promising paradigm
  - enables avoiding essential design conflicts
  - allows for reflexive/self-referential tools
  - contributes to user empowerment
- particularly suited for supporting IT management
  - provides conceptual support
  - enables adaptation of concepts and tools by users
  - integrates conceptual perspective with monitoring
- Xmodeler powerful language engineering and execution environment. However,
  - no static typing
  - New paradigm creates serious barriers.

- enterprise modeling: multilevel reconstruction of MEMO languages
- support for designing multilevel languages
  - analysis and design method
  - bottom-up approaches
- delegation
  - analysis of use cases (in multilevel environment)
  - guidelines for applying delegation
- process modeling
  - improving reuse through additional abstractions
  - improving consistent adaptation of processes

<http://www.wi-inf.uni-duisburg-essen.de/LE4MM/>

- There is need for many languages
- ... with different syntax and semantics.
- However, there is increasing need for integration, communication and collaboration.
- Language is evolving over time.
- Standards are good ... and evil.
- Hierarchies of languages that capture commonalities and allow for adaptation seem to be a good idea.

How can we tell whether existing languages are good enough ...  
and how can we make them better?
